Practical 15 – Web Log Analysis Using Webalizer

AIM

To examine web server log files and produce traffic statistics with the Webalizer tool.

REQUIREMENTS

Webalizer for Windows, a sample web server log file, Windows, and a web browser.

PROCEDURE

1. Start the Webalizer application.
2. Obtain a sample log generated by a web server.
3. Choose the log file and set the required configuration options.
4. Run Webalizer to analyze the selected log.
5. Open the generated HTML report in a browser and review its statistics.

WEB LOG

A web log stores details about requests received by a server, such as client IP address, date and time, requested URL, HTTP status, and transferred data size.

WEBALIZER

Webalizer is a log-analysis utility that transforms web server log records into statistical summaries and graphical HTML reports.

PARAMETERS ANALYZED

- Visitor and visit counts
- Number of requests and pages accessed
- Amount of data transferred
- Commonly requested URLs
- Referring websites
- HTTP response status codes
- Traffic summaries by day, month, and hour

INPUT

A web server log file containing request records and traffic details.

OUTPUT

An HTML report containing visitor and request totals, page views, traffic volume, popular URLs, referrers, and usage statistics.

OBSERVATION

After processing the sample log, Webalizer produced reports summarizing website visitors, requests, pages accessed, and data transferred.

RESULT

The supplied web log was analyzed with Webalizer, and statistical and graphical HTML reports were generated.
